

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	5 September 2026
Team ID	Individual
Project Name	An employee requests installation of licensed software through the Service Catalog
Maximum Marks	4 Marks

Functional Requirements:

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Software Request Submission	Employee selects the required software and submits the request.
FR-2	Request Processing	Create and manage the Request (REQ) and Requested Item (RITM). Store the submitted software request details. Link the request to the appropriate catalog item.
FR-3	Dynamic Approval	Allow approval or rejection of the software request. Stop fulfillment when the request is rejected.
FR-4	Fulfillment Task Creation	Automatically create a Catalog Task (SCTASK) after approval. Assign the task to the IT/Software Team. Provide the installation details required for fulfillment.
FR-5	Software Installation & Completion	IT/Software Team completes the installation task. Update the task status after installation. Complete the request after successful fulfillment.
FR-6	Request Tracking & Notifications	

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Service Catalog item should be simple, clear, and easy for employees to use when requesting licensed software.
NFR-2	Security	Only authorized users should access requests and approvals, and software installation should follow organizational security and approval controls.
NFR-3	Reliability	The workflow should consistently process requests from submission through approval and fulfillment without losing request information.
NFR-4	Performance	Request submission, workflow execution, approval routing, and task creation should complete within an acceptable response time.
NFR-5	Availability	The Service Catalog and software request workflow should be available to employees when they need to submit requests.
NFR-6	Scalability	The solution should support increasing numbers of software requests, users, and fulfillment tasks without major redesign.
